#### Intro

Measurements of filtration behavior and wall cake-building characteristics of a drilling fluid are fundamental to control and treatment of drilling fluids, as are various characteristics of the filtrate such as oil, water, or emulsion content. These factors are affected by the types and quantities of the solids in the fluid and their physical and chemical interactions, which in turn are affected by changing temperatures and pressures. The OFITE low pressure filter press helps determine filtration and wall cake-building properties of drilling fluids and is a useful tool for trend analysis in a wide range of applications.

Ideally a thin, low permeability filter cake is preferred which normally produces less filtrate or water lost to formation. Field experience has shown that the amount and physical state of the colloidal content of the fluid is of paramount importance. Muds that are low in colloidal content but high in inert solids (cuttings) will produce a thick filter cake on the wall of the hole. A thick filter cake restricts the passage of tools in the well and allows an excessive and often expensive amount of filtrate to pass into permeable formation. Improper filtration control often results in numerous undesirable effects some of which include wellbore instability, caving of formations, difficulty in running casing, and enhanced surge and swabbing effects. The OFITE filter press is a valuable tool to predict and prevent such effects.

The filter press design features a cell body to hold the mud sample, a pressure inlet, a base cap with screen and filter paper, and a drain tube to discharge filtrate into a graduated cylinder. The pressure cell is designed so that a  $3\frac{1}{2}$ " (9 cm) sheet of filter paper can be placed in the bottom of the chamber to remove particles from the fluid. The filtration area is the standard American Petroleum Institute (API) recommended filtration area of  $7.1 \pm 0.1$  in<sup>2</sup> (4,580  $\pm$  60 mm<sup>2</sup>). Pressure may be applied with any non-hazardous fluid medium, either gas or liquid. Some models are equipped with pressure regulators and may be pressurized with portable pressure cylinders (Nitrogen), midget pressure cartridges (Carbon Dioxide), or hydraulic pressure (clean tap water). The API recommends a standard cell pressure of  $100 \pm 5$  PSI (690  $\pm$  35 kPa) be applied to the fluid for a time period of 30 minutes. Suitable for field and laboratory use, OFITE Filter Presses have become the industry standard for low pressure/low temperature filtration testing for field and laboratory use.

## **Specifications**

Working Pressure: Working Temperature: Filtration Area Working Volume: Size: Weight: 100 PSI (689.5 kPa) Ambient 7.1 ± 0.1 in<sup>2</sup> (45.8 ± 0.6 cm<sup>2</sup>) 400 mL 9" × 8" × 19" (23 × 20 × 48 cm) 12 lb 7 oz (5.6 kg)
